

SkillKwiz

- SkillKwiz is a next-generation skill assessment platform designed to simplify and improve the hiring process for organizations.
- It helps companies evaluate candidates based on actual skills instead of relying only on resumes or traditional technical interviews.
- The platform focuses on secure assessments, enabling recruiters to make faster and more confident hiring decisions.

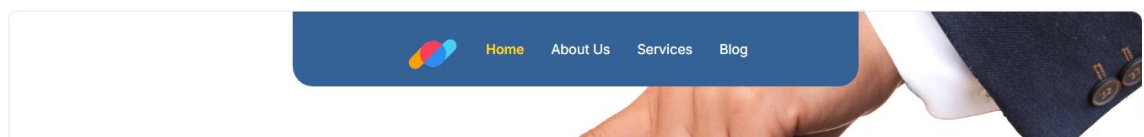

What it does

- It conducts structured skill assessments for candidates and generates detailed skill reports that reflect a candidate's real competency level.
- These reports can be directly used by hiring teams during selection, reducing the dependency on repeated technical interviews.
- If a candidate already has an existing SkillKwiz report, employers can access it directly. If not, the employer can authorize the candidate to take an assessment through the platform.

Key Features of SkillKwiz

- Skill-Based Assessments
- Detailed Skill Reports
- Candidate Authentication & Fraud Elimination

My Task

Logo needs to be visible with skillkwiz

My Approach :

- To achieve this, I placed the logo image and the 'SkillKwiz' text inside the same flex container

- I added the brand font and styling in global.css @layer components. This makes the branding reusable, maintainable, and consistent across the site.

Animations to be visible

My Approach :

Both images are stacked using absolute positioning. I handle hover at the image level instead of the container, whichever image the user hovers gets a higher z-index and animation. This allows the back image to come forward naturally and behave the same as the front one.

Who We Are ?

We are your partner in skill assessment. Our expertise lies in assessing skill levels in people and quantifying them...

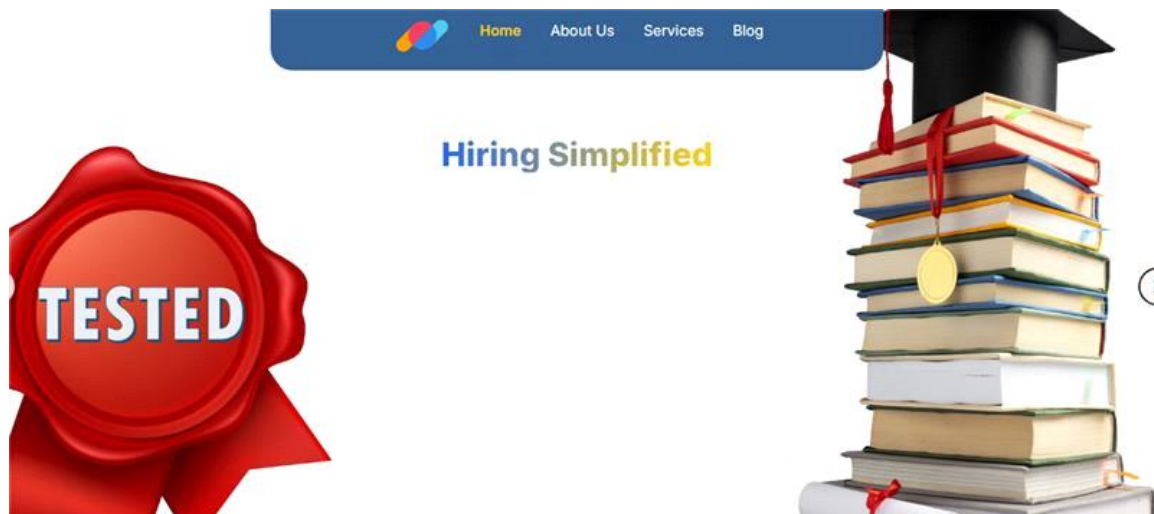

"SkillKwiz has a single purpose and that is to create stakeholder value..."

-Venugopal B A
CEO, SkillKwiz

gaps to be reduced

My Approach :

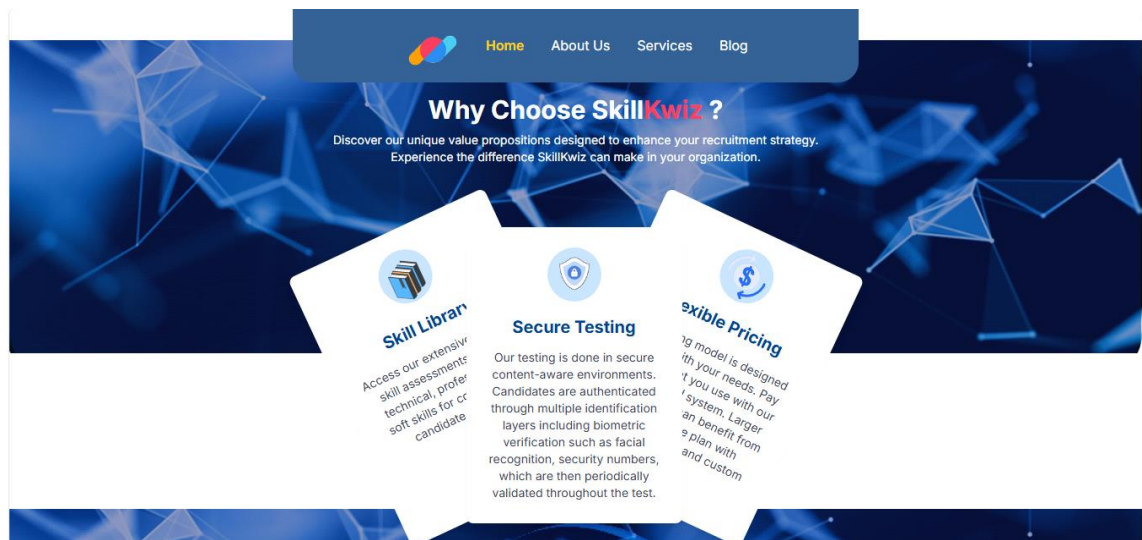

The extra space was coming from default margins and line-height. I reduce it by controlling margin-bottom and padding for a cleaner, more compact layout.

all banner Image size intersecting the header! make the changes accordingly and Banners should be with actual 4 slides as shared.

My Approach :

- The banner is overlapping the header because the header height is not being considered in layout spacing. I will restructure the layout so the banner starts below the header
- I will implement a responsive banner carousel with 4 actual slides. The carousel will include smooth animations, proper spacing below the header to prevent overlap.

Here the information in cards are hidden one below the other, i need to make responsive.

My Approach :

I will resolve the hidden card content by restructuring the layout, removing fixed heights

Adding the adequate padding inside each card to ensure the content has sufficient internal spacing and remains readable and also give a proper margin and spacing between cards to prevent overlap
